

L - Presentation of Designer's Recommendation

Taking into account that we made the vertical part of the bookend a triangle for design purposes, we believe that changing the shape to more of a square which would improve the structure of the bookend because the triangle shape covers less space over the book which can cause a disparity in the mass of the book being distributed across the vertical part of the bookend. To go further with this bookend project is making it more material effective by reducing length that is probably not needed as well as adding more screws for reinforcement.

If we did this project again we would keep the idea of the screws and use the same wood materials with its thickness. We would also keep the rubber bits on the bottom to cause friction to prevent the bookend from sliding on the bookshelf. We would change maybe the shape of the vertical part of the bookend as well as add more screws to provide more structure and reinforce the bookend itself so it can withstand more force and hold more mass. To make this addition to the project we would have needed to add more screws and drill holes in the bottom of the bookend that was attached to the vertical part of the bookend and put the screws in to connect them. The project would have been easier for us to complete if we knew actually what we wanted to do with the bookend because we had to change and edit our materials multiple times.
