Presentation Of Designer's Recommendations

Actually building our prototype can help the project go further immensely. Due to time constraints the team was unable to deliver a working prototype, rather than a 3D one that is presentable to our stakeholders. Another way this project could go further is making multiple designs for more than one teacher. The team would like to keep our methods in designs and reviewing while also implementing more strategies. We would also like to keep our final solution. We as a team believe that the design has the ability to satisfy the user needs of our stakeholders, while also our team being able to create a physical version to deliver. Adding to this we would like to keep the 3D software and modeling devices to help us visually see the design better than we would on paper. We would like to change the prototype, adding specific details and including all parts of the sketch so that the prototype, its features, and its functions are clear. We would also want to change the method of which the prototype was created. This time around, our prototype was created digitally, but next time we would like to create the prototype. Creating a tangible prototype that can be used by stakeholders is the next step. Taking into account that the prototype and hydroponics are of environmental fields, we believe choosing materials that were environmentally friendly would improve the impact that the prototype has because the unit being designed will be used to help with and teach about the environment and caring for it while in use and once the unit is not needed anymore. By using environmentally friendly materials, the unit can be turned into something else or recycled instead of being thrown out and taking up space in landfills. In hindsight, we believe that increasing the budget as well as the time limit could help improve the overall quality of this project because it would allow for a more diverse range of high quality materials that could be used to create an efficient hydroponic unit. An extended time limit would also contribute to the efficiency of the unit because it would give us a longer period of time to fully cover and plan out every step we need to take.
