A step that could be done to take this project even further would be to figure out how to more efficiently produce these covers. When we printed the cover, we ran into some issues, such as support that needed to be added during printing but removed later. If this process was made easier, there would be no problems with bringing this project forward.

The design we did was a good idea, as the prongs clip into place around the camera. This is an efficient design because of its ability to stay attached to the camera, because if it fell off easily, the camera would not be protected. Because of this, we would continue with this design due to how well it works.

However, one thing that we would do differently next time would be to change the color of the design. Originally, we made the whole design black, because that was the color of the camera. However, we later learned that that color would be too hard to see in the dark, so we decided to print any future designs in a brighter color. The inside can still be black if necessary, but the outside will still be an easier color to see, such as bright orange.

One thing that would have made the project easier to complete would be to have decided on a design to create earlier on in the process. We didn't decide on a design at first, meaning we all worked on our own designs separately, which ended up costing us time in the long run. If we all worked on the same design, we would have had an easier time getting through this project, as all of our contributions would make it to the design more easily.

We will move forward with this design by addressing these details.

The first part will be to find a better way to find a way to print these out without such cumbersome supports. Some potential ideas would be to use less thick supports, but printing it on another side besides the bottom won't do us any good, since that will only result in more supports.

We will also continue with the prong design in future iterations of our cover. We may need to refine the prongs more, to ensure they have better gripping power over the camera. The shape of the cover is something that we won't need to revise, though, as it fits around the camera well.

One thing that we could change to make the product better is the color of it. At first, we thought that the color of the camera lens cover should be black, so as to go with the rest of

the camera, as it was completely black. However, one concern of the stakeholder was the possibility of losing these covers, which is why we attached it to the camera with a string while it is not on the lens. The stakeholder said that we should make it a brighter color so that any students using it that took the string off for some reason would be less likely to lose it, as a black cover would be less noticeable than a brightly colored one. The stakeholder suggested a bright blue or a bright orange, as these are the colors of our high school.

The good news is that the issue of not being able to decide on a design is behind us, and we are able to all work on the same design. We are able to make up for lost time from the previous steps of the design process, since all of our contributions will be going to the same design.
