

Shower Device

Happy Campers

Element L: Presentation of Designer's Recommendations

Dormitory residents and dormitory guests of our boarding school need a device to place their shower products. This is because they would want their shower products to be easily accessible in the communal shower. They would also like to do this without having a personal shower caddy and without setting it on the floor because it is unsanitary. The main stakeholders are the dormitory residents. They need a solution because the showers in the dormitory were not built with a solution to this problem and dormitory residents are not permitted to leave their shower products in the shower area. The only place to put a device in the dormitory showers are on a relatively narrow divider wall of less than an inch wide.

Designing effectively means finding a balance between simplicity, teamwork, and accuracy. Using tools wisely and communicating within the team are crucial. Simple designs work better. Our 3D printer was a great tool, proving that less complex designs are more likely to succeed. Team communication matters. Regular updates and discussions help everyone stay on the same page. Our project's success depended on clear communication and working together.

Make the most of available tools. Our 3D printer was a game-changer, but smart material choices are important too. Assess project needs and pick materials that fit the purpose. Learn from mistakes. In our project, using suction cups or command strips would have been better than rope. Small miscalculations, like our off-center shelf, highlight the importance of precise measurements. In conclusion, design success comes from simplicity, teamwork, and precision. Avoid overthinking, communicate clearly, use tools wisely, and measure accurately for better

outcomes. Every project is a chance to improve our approach and create more successful designs in the future.
