

1. Always have many different plans and ideas. For example, we had two different wheel options. With the ones from the tire shops, there were no issues. When we went on our own and ordered from amazon we ran into an issue with axle sizing, not really rolling, and barely any tread. This helped us not have many days to wait in between and having both tires ready and comparable. obviously, if you are a welder you could do so much more with the design of the chariot but for our school needs we could only explore the tire differences.
2. Improvements to our project could be changing the size of the basket in the back. If you make it smaller it will not be as heavy, which causes the chariot to go slower. Although this is an improvement that needs a welder or a new chariot in all. Another improvement is to make a better grip. If there is a better grip, it would allow the people racing the chariot to pull it easier. You could buy a new grip from amazon or make a grip, although this was not feasible for us.
