

To think more about barrel placement (some time of the day its in direct sun), check that water will be able to flow into the pvc pipe from barrel (so water movement), precise measurements to use when buying materials and/or cutting up materials, research more materials and their alternatives, research more on overall other solutions to our problem other than the rain barrel, double check everything is environmentally friendly, use stakeholders and their help more, divide and conquer while also keeping everyone on the same page

Putting the barrel on an elevated surface so the water can flow more than at level to the ground.

A better filtering system for leaves, debris, and other objects that could clog the pipe opening or pipe.

Having a system that if the barrel reaches full water capacity (55 gallons), it somehow drains out from somewhere.
