Element L: Presentation of Designer's Recommendations

Content of Recommendations (L1, L2)

Answer as many of these questions as you can with specific recommendations based on your testing data, expert/stakeholder feedback, and any new research you've gathered. These recommendations may include process improvements (how you worked) and/or project improvements (actual design specific decisions you made). Provide recommendations to someone doing a similar project that might build or continue upon your work. For example: "Taking into account <something we did>, we believe doing _____ would improve _____ because _____."

- What could be done next to go further?
- What would you keep if you did the project again?
- What would you change?
- What would have made this project easier for you to complete?

In order to earn 5's on Element L, you will need specific and detailed ways the project can be improved and a rationale for why they are needed.

Taking into account that we ran out of time to finish completing the project, we believe doing more planning ahead on how to allocate time on the design process would have allowed us to make our truly final prototype and test it, which would have been an improvement on our more rudimentary prototype. We would implement this by, at the beginning of the project, skimming over every design requirement, allocating one day maximum to each, and working on the prototype in the extra time we have after.

Taking into account that our testing was very easy and objective, seen in how we were able to measure every single design requirement through testing, we believe that doing the extra work to create very good design requirements pays off in ease of testing. We would implement this by creating measurable and objective design requirements.

Taking into account that Mr. L recommended cheaper and lighter materials, along with Mr. Gregory (wood vs plywood), we believe that spending more time on planning and choosing simpler materials will pay off in savings and the final prototype. We would implement this by taking more time to consider the materials we use, and thinking about cheaper and lighter alternatives for each particular material throughout the design process.

Taking into account that the L-shaped connector between the constructed (prototype) shelf and the steel shelf was finicky, we believe that instead building the shelf on top of the steel supports by connecting wood beams perpendicular to the shelves and placing it on top would improve the stability of the design because there is a larger contact area. We would do this by sketching out a new plan without the L-shaped connector and with the new design idea, and then implementing it into the prototype itself by gluing the pieces together in between the two shelves, and elevating it on top of the steel supports.

Detailed Plans for Implementation of Improvements (L2)

Now that you have generated a list of specific recommendations with their rationale, go back under each and generate a consistently detailed list about HOW these details will be implemented. Refer back to Element I where you concluded with some of these ideas.
