

Element L

If we were to continue work on our project, we would have attempted to redo the petals so they look more realistic and hold up better. For example, we could use a different material that is lighter like the fake rose petals made of paper. This would make the petals look better and fall in a way that looks more realistic. A second change we would make is the motors. The motors were too fast, so we could use a different motor that had a way to limit the rotation speed. We could also change the motors we have now by limiting the currents that they receive which would cause them to spin slower. This would hopefully fix the problem with the fishing line getting tangled. We believe that with these changes, the rose would be more functional and look more visually appealing to the audience which were very important criteria to us.
