Element L: Presentation of Designer's Recommendations

Content of Recommendations (L1, L2)

- What could be done next to go further?

To progress our prototype, we should reconsider the materials we should use. For example, we had expert feedback that asked this question. It stated, "If you want this to go into different cars, think about making it out of a different material that is flexible or stretchy like a fabric for example." Reconsidering our design choices can allow for a better prototype. To wrap up, we could change our materials from rigid cardboard to something flexible for better results.

- What would you keep if you did the project again?

Our group would keep the problem of our project the same because it is so simple and complex. For example, when brainstorming possible solutions for Element D, we had a difficult time choosing solutions because there were so many good ones. This tells us that even though we had a great outcome with our prototype, we could still find other solutions.

- What would you change?

We would have changed the way we handled some Elements, specifically Element E because we failed to plan for the future and ended up editing the whole element. This problem we faced was caused because we had a lack of vision for future elements like Element H and I, and as a result, our group was set back multiple days. In the future, people following the engineering design roadmap should be cautious and aware of what they say in past elements because they often overlap and use the same information.

- What would have made this project easier for you to complete?

Having motivated teammates would have changed the whole dynamics of the design process and would have been a major advantage in completing the project. Our group wasn't lazy, but sometimes we had morale problems as a team. If teams can overcome this problem by being focused and motivated to complete their assignments, then the group will be successful.

Detailed Plans for Implementation of Improvements (L2)

To improve our design, we can find new materials like silicone, rubber, or plastic in tandem with foam that can provide a better user experience. For example, these materials would allow for the prototype to expand or retract based on size which could help with the accessibility for the product. This would help with the Proper Fit requirement that we assigned for testing in Element I.

Additionally, keeping the same problem in mind can be implemented more than once. For example, we can brainstorm new designs and concepts for the car gap to find more solutions to this common problem. We then can perform specific tests according to these new designs in Element I.

Next, if we were to change our thinking about our elements, one way to do this would be to think of the elements before we did them and apply our previous work to that element. For example, with Element I's test results, you have to heavily consider Element C, E, G, and H in order to complete it and have sophisticated testing for the prototype.

Finally, to raise morale in the group, we should have everyone in the group read the daily logs for the day at the beginning of each day in order to set the agenda and understand their job. This can be especially helpful in elements that involve testing like Element I because everyone can know their role during testing if everyone checks the daily logs to improve focus.

Step L: Presentation of Designer's Recommendations						
	score = 5	score = 4	score = 3	score = 2	score = 1	score = 0
L1. Content of recommendations. Recommendations include _____.	specific and detailed ways the project can be improved and a rationale for why they are needed	specific and detailed ways the project can be improved	some specific ways the project can be improved	one way the project can be improved	vague recommendation(s) for improvement of the project	no recommendations for improvement of the project
	score = 5	score = 4	score = 3	score = 2	score = 1	score = 0

L2. Detailed plans for

MyDesign Portfolio - Element L Initial Template
