Element L: Presentation of Designer's Recommendations

In the boys dorms the dorm residents need a place to put their toiletries because there is not a built-in shelf in the communal showers and setting things on the floor is unsanitary. Solving the problem can help the dorm students place their toiletries somewhere without having to set it down on the ground. The problem is that there is nowhere to hang your shampoo and that leads to people putting it on the ground.

Some of the recommendations that we would give to someone is that they should always figure out what the problem is before they start to work. This is because if they stop and try to figure out what may be causing the problem then they can get it fixed faster.

Another recommendation is that the person should get materials that are actually going to be used or are going to work. Getting the right materials is a high priority and that is because it sometimes takes a long time for the materials to arrive. There are always ways to make your design better and it is always good to start over and brainstorm an idea. We could add a side hook for people to place things on as recommended by one of our stakeholders and experts and improve on the stability and functionality of the hooks and stability of caddy. We wanted to add the hooks as an extension to the caddy so the customer can have the hooks there for later.

Another improvement is to add bigger grates to the bottom so that the water will be able to drain faster. The grates are there for when people are done having their shower it will be easier to clean out the caddy. These suggestions were used and the caddy itself is better for the residents

in the dorm. The caddy will be used by everyone and that is why we added the new solutions to the original design.
