

Element L

After completing the rose prototype and taking it through multiple rounds of testing our group has come up with many things that we have done well and many things that could be improved upon if we were to do this project again in the future. Our group had a good concept and it just needed a little more refining to make it perfect. The pulling of strings to drop the petals was a simple but effective solution and it accomplished the goal of dropping petals on cue. If our current design were to be improved we would replace the fishing line/paperclip junction with a more stable material. The concept was good, but in practice the paperclips kept sliding off the fishing line and the lines got tangled when we started pulling them off the cup. If this were to be repeated it would be better to use a thicker string type material to avoid tangling and the slipperiness of the fishing line on metal. Our rose would also look a little more realistic if the paint was to be more opaque and sturdy. In a future endeavor we would get some higher quality paint and a clear coat to keep it from rubbing off once it was dry. We would also use a different material for the stem. Our pvc pipe worked well but it didn't look very lifelike, even after the clay and paint. If we were to redo the project we would use a more organic shaped stem material.
