

Element L

To further improve our design and create a finished product our team can be proud of there are a few steps we need to take. First we would do a better job with the division of labor, so no one was idling. Second we would properly fix our design onto the launcher and gain some experimental data for the angles of launch on the base. If we had the chance to redo the project I think we would work more with the build team so that both automation and build were on the same page. We would also do more documentation of where we found different ideas and would put more time and effort into our elements. The main thing that impeded our progress for both the base design and the coding was the 2 week period where we had no wifi at school. To better prepare for such an issue we should've met outside of school at either each other's house or the library.

To implement these plans and ideas we would start doing team management journals and make sure to keep everyone up to date with the project progress. This would allow for increased efficiency and make sure everyone is on the same page. Furthermore we would create our own schedule of when we want specific parts to be done. This could be implemented easily as the code itself had different sections that we could've specified when we wanted them done.

The main lessons we've learned from this project is the importance of working as a team and not dividing and expecting everything to work perfectly. Issues do come up and it is important to prepare ourselves to deal with them.
