Element L: Presentation of Designer's Recommendation

Plans for Implemented Improvements:

- Taking into account the problem of the left door not closing fully, we believe that adding a magnet would allow for the door to sit flush while still allowing for it to be easily stored, as to separate from the magnet the user would simply have to pull with a minimal force.
 - We talked with our teacher and he said that he would ensure this part is done since we are coming to the end of the year. Because adding a magnet requires minimal work, this can be done by anyone who is briefed on the issue and given the resources.
- Taking into account the problem of the right door rubbing against the bottom, we believe that this problem is minimal and does not pose a threat to the utilization of the space for storage. The primary user of the space, Ms. Brennan insisted that it wasn't a huge problem after we told her she just had to lift the door while closing to have it slide in neatly.
 - There is no need for any further action. Possible solutions would require disassembly of the door which has potential to do more harm than good. It is better to leave this as is, especially since we have planned with Ms. Brennan that the space be used for items not frequently needed.
