

Element I

How the tests went/data collected by the Penn state field of medicine came out with the AI tool Istar that they claimed could detect cancer tissue faster than any doctor or test. The doctors at Upenn evaluated iStar on many different types of cancer tissue, including breast, prostate, kidney, and colorectal cancers, mixed with healthy tissues. This test was to determine the efficiency and the accuracy. Ultimately iStar was able to automatically detect tumor and cancer cells that were hard to identify just by eye and was about 213 times faster. Making Istar a very efficient and reliable second opinion for doctors.
