Date: _____

Class: _____

Element I Initial Template

Table of Results:

Test Name	Device scalability and accuracy	User input accuracy	Peak hour classification	Priority of test
Test Results (Values for each test trial with measurement units)	Ten devices correctly recommended in both peak and off-peak conditions	Ten device names, kWh values, and essential values correctly stored and used	“Morning” and “Night” = off-peak, “Afternoon” and “Evening” = peak	High
Number of Trials (How many trials of the test did you perform?)	4	2	4	High
Observations: What observations did you make about the tests?	Program worked consistently and did not freeze or crash	Inputs were correctly stored with no false values	Time was correctly classified. Decision logic adapted appropriately each time	High
Pass/ Fail	pass	pass	pass	

Name: Anthony Claudet**Date:** _____**Class:** _____

Summary of the testing data:

Verbal Summary: Each test was high priority and resulted in a pass, with a number of trials depending on the number of different outcomes possible. The creation of the program was a long and intricate task full of trial and error, and thankfully, the effort has paid off now that it passes these tests and meets the requirements.

Tables and Graphs:

The table above is an effective summary of the test data.
