

1. number and name of the test (as referenced in Element

Test: 1 EX-1

2. indication of whether the test is high, medium, or low priority based on your requirements (as reference in Element C) The test is a very high priority, the 10x20 tray is a high priority test
3. for physical tests, include an explanation of your process and the full set of raw data such that the following best practices for scientific testing and mathematical modeling will be evident:
 - creating experimental controls
 - defining independent and dependent variables
 - only changing one variable at a time and changing it in increments to find a trend
 - collecting at least FIVE trials for each variable increment
 - plotting data appropriately (e.g. scatter plot with trendline for continuous variables, bar charts/histogram for non-continuous variables, acknowledging and recording error as appropriate, and labeling random and systematic errors).
 - We created experimental controls but they failed because our button messed up
 - Independent variable is the plant shade and the dependent variable is the plant
 - Our controls did not work so we had to use wires
4. summary of your data with appropriate charts, graphics, spreadsheets, etc., drawing on best practices in science and math for data display and analysis-We didn't do a spreadsheet but I have pictures and a video of our project working correctly.
5. statement of what the data means and a summary of the implications of the data you collected
 - A possible sentence could be, "Based on our testing data, we found that <trend in data> means <something about the design's success> because <logic of conclusion>."
 - It worked then didn't work and it was a lot of off and on but we finished and it worked the whole time towards the end.

6. discussions about *each* implication from the summary of your dataThe data we collected was spotty because like I said ours stopped working and the data we did get was very good and when it did work it worked very well.
7. next steps for your design and process from the new information from the test that was conducted-The next steps are a good reliable roof so when can use it without it coming off and a button so we don't have to keep taking the wire off and on .Also a good brace on the front so it will stay in place
