

Element I: Testing, Data Collection and Analysis

Our school's students that attend sports after school that participate in strength and conditioning, this is where students lift and do indoor exercises, need more time, space, and equipment in the weight room. This is because there is not enough time given only 45 minutes to productively work out in the gym, with the limited amount of time given. The problem is that all of our current solutions either take a faculty member's time or more money to create. The people involved include Mr. B, who is the athletic director, our school's students, these are the students who use the gym and our school as a whole. The issue is occurring during afternoon programming, which is an issue due to a lack of time for students to work out.

We interviewed a variety of students that attend our school. The people we interviewed included a range of both females and males, and grades eight through twelfth. We did this in order to get a variety of perspectives on the weight room.

Below is a chart of the answers that were given by the students:

ANSWERS	Would it be helpful if more weights were provided?	Are you planning on taking it again?	Would you want to try a new schedule?
yes	8	10	6
no/unsure	4	2	6

Our data shows that some students are for the new schedule and some are against. A lot of students suggested larger equipment rather than smaller pieces such as dumbbells, such as stairmaster and leg extension machines. Several students complained about the complexity of the new schedule and being outside. We feel that

overall changing the schedule may not be the answer.

When we talked to Mr. B about our final prototype for strength and conditioning, he had a great response. He stated that he would be happy to try and get more of the machines that were suggested to us while surveying them. Mr. B liked our ideas of having three sections and even mentioned how he has wanted to try and expand the weight room.
