

Element I and J (Testing plan feedback/Analysis)

Test Analysis

The device was able to pass all the different tests.

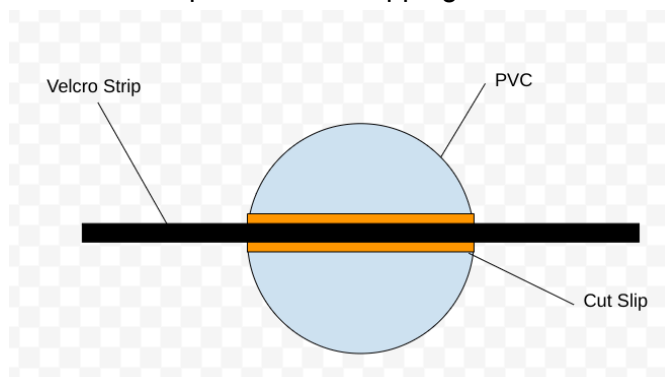

1st test Dribble test: Give more clear detail about how to place the device on wheelchair and secure it with velcro. Otherwise we were able to dribble the ball back and forth. The device was successfully able to dribble the ball back and forth with the hockey stick.

2nd test Adjustable test: The prototype is adjustable, but because of that it feels too loose along with being flimsy. We need to fix how loose it is, so it can be adjustable, but also more stable. The device even though be a little loose and flimsy was able to successfully change size very easily.

3rd test does it fit on the wheelchair: The adjustable device along with the velcro straps made our device accessible to any size of wheelchair. It's easy to alter and fit all wheelchair types. The device was able to successfully fit onto the wheelchair along with adjust and fit multiple different wheelchairs.

Iteration Ideas

1. **Velcro straps:** We could cut a slip on the side of the pvc pipes, so the velcro straps could go through the slip and wrap around the wheelchair. It would also help not loose the velcro straps when unwrapping the from the arms of a wheelchair.

2. **Adjustable device less loose along with being less flimsy:** We could make the sliding mechanism tighter/closer to the PVC pipe, so it will not be as loose. We could also find a way a to lock the other side of the invention, so it stops moving around so much. While also making sure we can still disassemble the device.
