

## Element H

Our prototype is constructed with sufficient functionality the reason for this cause when we were making the prototype we did a few different things that would insure that the prototype is going to be successful. The first thing that we did was we sat down in a group and started writing down ideas for our prototype. Then we all did a rough sketch of the prototype and compared them to choose what prototype covered the best amount of requirements. Then we combined all of the prototypes to make a prototype with no flaws. After we had all of the requirements for the design it was time to start thinking about what materials would be the most effective. Then after we thought of the most effective materials we started to get the measurements for the stuff. Once we got the materials we put the prototype together and we tested our prototype on the problem and fixed all of its flaws before we started to fix it.

## Element I

The first thing that we did was make our final design then we went into Mr Blanchard's room and greeted him. Then we asked him where he wanted us to put the design before we permanently attached it to the wall. Then we attached the design onto the wall and finished setting it up while clipping the blinds closed and securing the 3m pad onto the wall. After that, we made some improvements to the design once it was on the wall and made sure it was ready to go. After that we got Mr. Blanchards feedback and he told us what the thought was really good and what he wanted us to change. Once we got the feedback from him we went back to our classroom and got the materials to fix the part that he wanted us too . Once we got the materials we went back to his classroom and fixed the part that needed to be fixed. After that he told us it was good and we were done with the test plan.

## Element J

We got multiple feedback from our stakeholders. The first time that we went to the stakeholder to get feedback from him was after we showed him our rough draft sketch. He said that he really liked our rough draft sketch and thought it was going to work really well. Then we went back into his room once we made the actual prototype and showed it to him and he thought once we attached it on that it was going to work great and it looked really nice. The third time we went back to the stakeholder to get feedback was once we made our final design and showed him the final design and asked him where he wanted us to put it on. he and once we attach it to the wall he told us that it looked really good but to just add some more 3M sticky tape to the base of the 3M sticky pad. Once he told us the design looked good that's when we went back to our classroom and waited for a couple of days to go back into the classroom and go to see what the wanted too say. A few days later once we went back into his room to get feedback from him he told us that design was holding up really well and that he didn't really have anything bad to say about the design. he told us that the design met all the requirements that he wanted including the looks requirements and the requirements of it actually working. That is the feedback that we got from our stakeholder.
