

Element I

Testing, Data Collection and Analysis

The student engineers weren't able to get to this stage of the project, and were only able to test the humidity sensors on different types of containers. After analyzing the data, the students discovered that the best containers were the tupperware container the cigar box. With this information, the project will be continued throughout the rest of the school year and the beginning of the next school year. They will later test by adding the art materials (paper and clay) in the cigar box (since the students decided that they will test on the cigar box rather than the tupperware), to prove if the cigar box is actually humidity proof.
