

Test justification

We did not get to test our prototype, in fact we did not get the chance to produce one. There are certain things we did want to test however. Test 3 called "it cleans good" would be a high priority. We did not test it so there is no documentation of possible data per test. An implication of this would be to ensure that our product would always go through and figure out what would work. Also it was important to make sure that it would go through in a certain amount of time and not be harmful to users. Test 4 called "its efficient" would be of high priority. An implication of this would be to make sure that the tablet does not affect any of the showers normal everyday functionality. Test 5 is called "its durable" would be a high priority. An implication would be that we could not have even tested its durability even if we did have a prototype. We would not have been able to test the amount of time that this product would have worked due to time constraints. Test 6 called "its cheap" would be of a lower priority. While it is important to have a showerhead that is affordable, it's also important to have all the materials we would have needed. That would be of high priority, this is also considered an implication of this test. The cheaper we would have gone, the less efficient our product would have been likely to be.
