

Element I

Testing, Data Collection and Analysis

Our solution tested relatively okay, with many areas for improvement but also areas of success. We were able to understand that the general design idea worked well, however, areas like the basin, pump, and overall height may need to be worked on. Some things we need to work on are the overall height to account for plant growth as well as how the pump will exactly function. Showing our testing data results is undetermined but can be determined in future projects by applying this design to other projects can make their results definable. The analysis made after our meeting with Mr. Roberson helped us by giving valuable insight about our design and solution. It also helped us to determine what questions we would need to ask our stakeholders to elaborate on, such as what exact plants need to be grown and what type of nutrients we would need. In order to complete the testing we have to use this design in future projects which will address solutions to our lack of data.
