

1.

2. Our procedures:

- We measured the old tires and both sets of new tires to compare them. We analyzed the treading and decided what we wanted in order to make the chariot move as fast as possible
- We ran the chariot in multiple trials with the old tires, timing and videoing it, and then putting on the new tires

3.

	Trial 1	Trial 2	Average
Old Tires	26 seconds	24 seconds	25 seconds
Tire shop tires	20 seconds	22 seconds	21 seconds
Amazon tires	n/a	n/a	n/a

4. Our data of racing the chariot showed that our new tires from the tire shop were efficient and helped us reach our goal to make the chariot race faster. The treading and size of the new tires allowed us to pull the chariot in a smoother manner, where it could glide well on turf and move at a faster pace.
