

Element I

Our first test was testing if one petal could be seen dropping from the rose from the back of the theater. We brought the rose on stage and one person held it, and the other scattered around the back of the theater. The person holding the rose let the petal fall and then we all came back to report what we saw. The consensus was that we could all see the petal, but you had to squint or look very hard to see it drop. To fix this we stacked 2 petals and glued them together to make them look larger and we could see the petal much clearer. Our second test was getting all of the strings lined up and doing a full loaded runthrough with the rose. We wanted to see what it would look like from the audience and see if our current design was capable of running the show the whole way through with the petals dropping on command. We attempted to conduct this test, but the strings got tangled very often and the petals kept slipping off the paper clips before they were pulled. To combat this and continue with our testing we tried out different angles of the paperclips and had ideas for new hook mechanisms. Unfortunately, due to time constraints, we weren't able to get a working solution to this problem and therefore didn't get to complete our final round of testing.

Pictures from various stages of building and new fixes after testing.
