

Notes:

1. By hanging the installation up in a space where students can observe it, we can collect thoughts on how well it meets our design requirements. Mainly the requirements of not cluttering the space and the ability to reflect incoming natural light. All opinions will be taken in as data and depending on the responses, we can make necessary changes to our work.
2. Our testing procedures included hanging the art work up in the lobby. This will allow us feedback from viewers, make sure it can stay hung up without getting tangled, and reflect light from the windows. Our highest priority for this piece of art is making sure the piece can hang from the ceiling, making sure it moves, and making sure it fits well in the staircase. All of these were met in our test.
3. To test our design we hung both frames in the lobby of the art building. We asked for feedback from teachers. Mrs. Seltzer suggested using nail polish remover to remove the burn marks from the acrylic squares. She also suggested making the lengths of the strings more even.
4. Hanging them up also tested their ability to stay hung while not getting tangled. Over the past weeks they have been in a populated area and did not tangle once. This is good because in the classroom they got very tangled and some had to be cut off.

Stakeholder	Feedback
Vogel:	- Create a grid that does not make any non functional squares - Move the hole farther apart
Seltzer:	- Use nail polish remover to remove burn makes - Make the string lengths more even
Bussey:	- Looks great!

5. Our next steps of this project are to remove the burn marks and edit the lengths of the strings. After this we will finish our project.
