Problem statement :

The problem is that the Piedmont Wildlife Center needs a better hideaway for their rabbits. The requirements of this New design for the Centers hideaway consist of a safer and more accesable design with places to isolate the rabbits from each other, while also keeping them in supervision from the staff. This hideaway needs to also have a safe material for the rabbits to chew on that wouldn't harm them. The rabbits like dark spaces so we need to include spaces where it doesn't get as much light access to it. It also does not need to occupy more than $\frac{1}{4}$ to $\frac{1}{3}$ of the floor space in the enclosure. Each component must not weigh more than 15lbs and has to be able to close down to smaller parts to easily be taken out of the enclosure.

- 1) The stakeholders, the Piedmont Wildlife Center, and The E4USA
- 2) They want us to build an enclosure for 2 of their rabbits that has many requirements so that the rabbits have a better chance of not getting hurt.
- 3) The Piedmont Wildlife Center. With their rabbits.
- 4) The size of the issue is major because the sharp edges the enclosure has now could risk the rabbits lives or cause other issues.
- 7) Because the enclosure they have now does not meet the requirements and can injure the rabbits.
- 8) This problem happens everyday in the center where the rabbits stay.

Stakeholder concerns :

Name: _____

Date: _____

Class: _____

This problem needs to be solved now because the rabbits could eat the plywood and since there is glue in it and glue has chemicals they could get sick or even die. They also need a lot more space and the structure they have now only allowed that one build set up and doesn't allow now challenges for the rabbits to learn. They also have a lot of requirements that the structure doesn't meet and doesn't give the rabbit the opportunity to not get bored. The data we have gathered also shows that rabbits don't get to experience anything and just lay around most of the time.

While researching, materials/toys that are safe for rabbits to chew or even consume that wouldn't cause digestion issues. These materials/toys that are safe are untreated wood, willow, thick cardboard, grass hay, or even twine. The materials allow the rabbits to have things to chew for their teeth without harming them. The untreated wood could be a base for the building that if they decide to chew it doesn't contain chemicals that would make them sick. The willow could be the material we use for the "hay bag" that if they consume it, it won't make them sick and it's thin so it can be easily digested. The twine is another material that can be used for toys or even something to just have for chewing. These are the pros and cons of these materials if they consume too much of the material it can affect them then so if these become a possible idea we need to make sure the consumption of these materials need to be limited. My sources that gave me information are
