Element B Initial Template

How to use this template

Teachers: You may customize this document before providing it to students.

Students: The template below is one way to structure your research findings around past and current attempts to solve the problem, but the specific assignment given by your instructor may require a different structure or dictate different details. If you make a copy of this template to edit for your own research into prior design attempts, be sure to delete the instructions.

Element B: Documentation and Analysis of Prior Design Attempts

Prior Design Attempt #1 - **Uline painters plastic** Source

State the source of the information about this prior design attempt, which should be taken from any of the following credible source categories: peer-reviewed journals (check out your public library for free digital access to journals; here are some [free online journals and research databases](#)), professional organizations, government agencies, local and national newspapers, patents (here is a [patent search site for the United States Patent and Trademark Office](#)), and reputable vendors and manufacturers. Make sure to incorporate [in-text citations](#) in the details section below (i.e. don't just give a list at the end of the element or footnote).

Include at least one image of this prior design attempt. Make sure to cite all images.

Details

Include main details about this prior design attempt

This design attempt removes the issue of ruining the paint with your shoes and or paint dripping onto the floor therefore ruining it. This correlates to our problem by representing how bishop mcnamara athletics do not allow cleats in the fine arts building to prevent the tracking of dirt turf and to eliminate the possibility of injury. This design attempt is flawed because this type of plastic material, cleats will most likely rip through the plastic due to how its material is meant for flat shoe users. This doesn't mean it is not helpful, as it still removes the problem of tearing up the floor in the fine arts center and will most likely prevent slipping. Which is overall the goal for this design attempt.

Analysis

Provide evidence and explain what parts of this prior design attempt were unsuccessful at solving the defined problem and why based on design requirements.

Prior Design Attempt #2 - <insert name of prior design attempt #2>

Source

State the source of the information about this prior design attempt, which should be taken from any of the following credible source categories: peer-reviewed journals (check out your public library for free digital access to journals; here are some [free online journals and research databases](#)), professional organizations, government agencies, local and national newspapers, patents (here is a [patent search site for the United States Patent and Trademark Office](#)), and reputable vendors and manufacturers. Details

The creation of house slippers to replace wearing regular shoes in the house, to prevent tracking things from inside and to create comfortability while walking in the house.

Analysis

House slippers can cause foot pain and "slipper syndrome". Slipper syndrome causes people between colder mornings and post holiday to want to stay inside more. This also causes pain in the ball of the foot or mid arch if you wear them too much.

Strength: The structure of the house slippers will help capture all of the dirt that is at the bottom of the cleats. While also preventing the risk of slipping and hurting themselves which is also a drawback within this problem.

Weakness: The slippers are not meant to fit a cleat, it cannot fit a cleat and it will stretch the shoe and maybe break the slipper if worn with cleats on. Which ruins the point of this solution therefore making this attempt unsuccessful for this particular problem.

Include main details about this prior design attempt

The purpose and the main idea of this floor cover is to prevent people from slipping on surfaces, for example when walking to the bathroom or going outside in the rain, etc. This product also helps with keeping everyone's houses clean and making the environment a cleaner and better place.

Analysis

This design is made to prevent slipping on wet, dirty, and hard surfaces, such as in bathrooms or when coming in from the dirty muddy rain. This will also prevent slipping because of the silicone material which is sometimes meant to stick to surfaces and in this circumstance will be beneficial for this problem we have within the athletic department.

Name: _____

Date: _____

Class: _____

Strengths: Cleanliness- The product helps in keeping indoor environments, such as bathrooms at amusement parks, coming back from school in rainy muddy conditions, and is easy to take off.

Residue-Free: The material of the Sole Cleaner is made out of "Crystal-Clear TPU" and is designed to leave no residue on the floor.

Versatility: It is designed for multiple environments.

Weakness: Durability with Special Footwear- Shoe covers often fail when used with athletic cleats, as sharp points can easily rip through the material.

Specific Limitations- While effective for general rain and mud, it may not be robust enough to handle the heavy-duty turf and dirt tracked specifically by athletes moving between fields, buildings and housing.

Provide evidence and explain what parts of this prior design attempt were unsuccessful at solving the defined problem and why based on design requirements.

Prior Design Attempt #4 - <insert name of prior design attempt #4>

Source

State the source of the information about this prior design attempt, which should be taken from any of the following credible source categories: peer-reviewed journals (check out your public library for free digital access to journals; here are some [free online journals and research databases](#)), professional organizations, government agencies, local and national newspapers, patents (here is a [patent search site for the United States Patent and Trademark Office](#)), and reputable vendors and manufacturers. Make sure to incorporate [in-text citations](#) in the details section below (i.e. don't just give a list at the end of the element or footnote).

Class: _____

Include at least one image of this prior design attempt. Make sure to cite all images.

The log mat acts as a cover so that people can make it to the bathroom without slipping on the hard floor. This would also protect the floor from scratches and residue. They are very easy to clean and convenient to handle.

Some strengths would be that the athletes would be able to walk in the building without the risk of slipping on the hard surface. A main weakness would be it takes time and resources to wash them and they also may be a tripping hazard to people who are not paying attention to where they are alking

Prior Design Attempt #5 - <insert name of prior design attempt #5>

Source

State the source of the information about this prior design attempt, which should be taken from any of the following credible source categories: peer-reviewed journals (check out your public library for free digital access to journals; here are some [free online journals and research databases](#)), professional organizations, government agencies, local and national newspapers, patents (here is a [patent search site for the United States Patent and Trademark Office](#)), and reputable vendors and manufacturers. [Image Link](#)

Include at least one image of this prior design attempt. Make sure to cite all images.

Details

Include main details about this prior design attempt

Analysis The shoe covers go on your shoes so that dirt is not tracking all over the floor. It was unsuccessful because cleats are very pointy at the bottom so it would rip the bottom of the cover.

Strength: The advantage of these covers is the ability to prevent dirt or mud to track all over a clean floor. It is light weight and a very affordable solution for standard indoor environments.

Weakness: The thin material is easily cut by the sharp things at the bottom of an athlete's cleat. The lack of durability makes them ineffective for athletes that go from field to indoor back to the field.

Provide evidence and explain what parts of this prior design attempt were unsuccessful at solving the defined problem and why based on design requirements.
