

Element B

1.

Details: This map explains how to organize a clear design on how to navigate student classes. It includes the shapes of the classes, the hallways and the doors on where to enter. However, like our proposed/modified design, it does not include colors, QR code, and it is not very visually appealing.

Analysis: This map is a good idea on what to base our map on, however it doesn't meet the appealing requirements we would like for our stakeholders. It would be better to modify this map into a specific version, specifically for our stakeholders.

2.

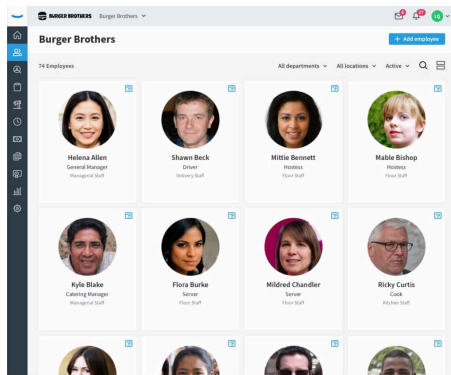

Details: This image is a demonstration of a ski slope map, it includes the different paths to take and a key of how to read the map. Additionally is the map is propped up by legs to hold it high in order for people to read the map.

Analysis: Our map will not be of a ski slope, nor will it have two stability legs on either side of the map propping it up. However, it is a good representation of how to organize the map using a key and making a rectangle map with a feature of stability.

3.

Details: This is a picture of a website listing employees at a company. It is designed to show extra information to anyone visiting the website. The most prevalent part is the inclusion of their faces. It also showcases their respective names, jobs, and work locations.

Analysis: This is a good idea for what the website attached to our QR code will appear as. Our website will likely have names, class location, and the subject they teach/profession. The inclusion of pictures of them will be determined later on, and if we don't use that idea, we will still definitely include the other information stated.

Details: This list, pictured on Synergy, showcases teacher names and their corresponding classrooms. Clicking on their names also directs you to Gmail in order to email them directly. It is a relatively simple but efficient design, and a good way to be able to contact them with ease.

Analysis: This is a really good design, as it not only has good information, but an easy way to contact any teacher you have. I think that our design will be more aesthetically pleasing, and less bland. It will also have the teacher's professions as well as their temp numbers. Only one teacher here has a temp class, and that will obviously be applied to all of the teachers listed on our website. The direct link to the teachers is a great addition that would be great to add to the project.

5.

Details: This is a map showing the different rails and stations of the metro trains in Chicago. It shows the different lines/trains by color and which stations you can switch trains at. However, it cannot easily be updated if the stations change or if the trains change colors. It can also be confusing to new people learning the metro system, and they might miss their stops.

Analysis: This map is a good concept, but our map will have a QR code to easily update the teachers and classes, and will be less complicated.
