

Element B: Documentation and Analysis of Prior Solution Attempts

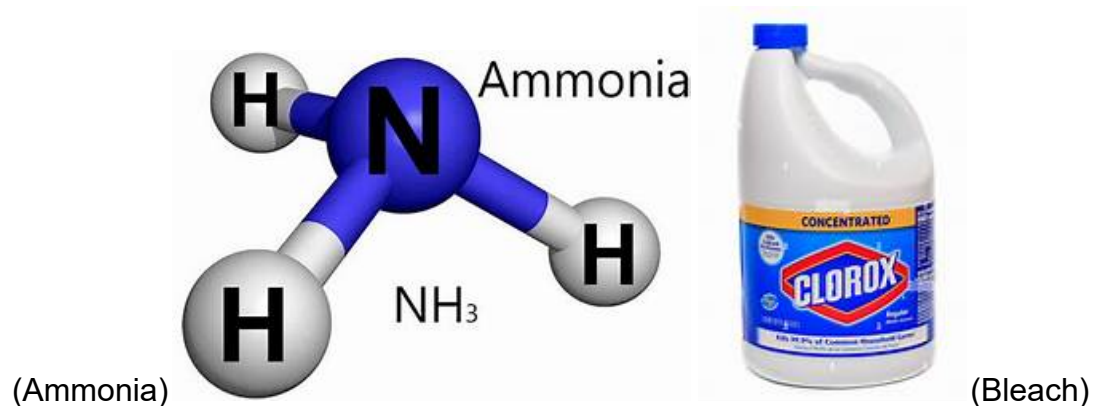

Many of the teachers and students at our school are wasting paper. They are not recycling or using the paper for other projects. This is a pretty big issue as it affects the environment. For this project, our team is trying to find a way to reuse a stack of used paper so that it can be used again, otherwise it would just be thrown in the trash, which is not very eco-friendly. There are several attempts to save or recycle paper. One way to save paper involves a reusable paper that sends your writing to your phone. This attempt is good because the paper is reusable when you are done, it erases easily and is sent to your phone so you have a digital backup, and you do not always have to carry a notebook around. The down side of the notebook is that it only has 32 pages to write on at once. This notebook might not meet the stakeholders requirements because the notebook is too big to fit in a pocket. It is also too expensive and it costs 30 dollars. (Amazon.Com)

(Reusable notebook)

Another method is using ammonia which would dissolve the acids used in the ink dye. This would work, but it might ruin the quality of paper and it is toxic, so you would

have to be careful when using it. You could also use bleach as well, which would break down the chemical bonds in the dye molecules. It might ruin the quality of the paper, it is toxic, poisonous to ingest, and can cause skin irritation. It is also dangerous if you are exposed to its vapor for too long. (*How to Remove Ink from Paper?*, n.d., Part 2)

One of our stakeholders, Mrs. R, who is the Spanish teacher at our school, as well as other teachers, are using the leftover scrap paper to write notes on when they can so that the paper does not just sit and collect dust or get thrown away. The benefits of using the misprints to write notes on is that the paper is not going to be a complete waste. The down side is that it takes up a lot of storage and only one side of the paper is usable.
