

## Element B:

This design is unsuccessful for solving the defined problem because though you can see the rabbits better it is still too small for the rabbits to live in. It has no challenges or level for the rabbits to have activity and the wood may not be good for them to chew on. This design also has a wire like bottom which can be unsafe for the rabbits.

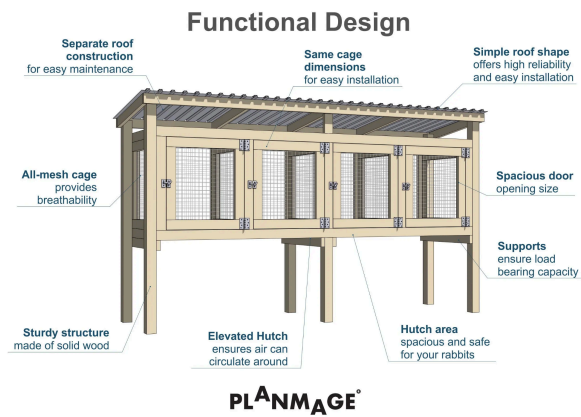

This design is unsuccessful, and the design has a problem, it has a small triangle where if the rabbits go in there people can't see them and it is also hard for workers to have access to the rabbits whenever they need. The wood can also be a problem depending on what it is made with, which may be harmful to the rabbits. This design is also too small for two rabbits to live in.

I think that this is a successful design because it's a safe enclosure , you could see the rabbit clearly because there's nothing blocking it and you're able to clean it easier because it's open . But i think its meant for only one rabbit because it's not really that big in length.

This design seems pretty successful as it is big enough, can see them clearly, and seems safe for the rabbits. Its unsuccessful parts are that it is maybe too tall so they might be hard to reach into the enclosure, doesn't have any built in activity structure just ones added in, and it doesn't have levels.

This structure has it where you can see the rabbits, seems pretty safe, and they are able to access them easily. The unsuccessful parts of this structure include the wood, the space, and not much activity.
