Element B: Documentation and Analysis of Prior Design Attempt

Toyota Mirai, a hydrogen-powered car.

<https://www.toyota.com/mirai/>

Name: _____

Date: _____

Class: _____

The first hydrogen production car.

The car is only available in California, making it less effective.

<The Citroën DS

The previous solution to this car was to make this design cheaper and more available to the public, and also design it again so the technology can be more available to make a better car. Also, it was not really available to the public and made the business bankrupt

Name: _____

Date: _____

Class: _____

This car could run on anything, but it had many problems due to its high cost of production and maintenance. Additionally, the engine would often break down. And also, the gas companies and other car companies were trying to get rid of the car

The engine could run on anything and wouldn't even need gas, so it would be an amazing car for the future to cool down the planet and to help keep the air clean

The Citroën DS was discontinued in 1975, not because it failed, but because its replacement, the Citroën CX, was introduced in 1974 and its production ramped up to replace the aging DS and also the car could last longer with very little gas and didn't always need to get replaced or to be fixed.

Prior Design Attempt #3

https://en.wikipedia.org/wiki/Hyundai_Nexo#/media/File:Hyundai_Nexo_%E2%80%93_f_16032019.jpg

Hydrogen refuel stations are few and far between, despite having ~826 KM, and 179km/h, only available in California due to hydrogen fuel infrastructure not being available in other states. This car might be the first one to be able to be used across the world assuming hydrogen

Name: _____

Date: _____

Class: _____

stations are present. It is the first suv of this kind of car that will be mass-produced. And his car might be the absolute best for a car of this type.

It is unsuccessful for one reason and that is no hydrogen infrastructure outside of california, and it will probably be incredibly expensive 50k+, it also has risk of exploding if the hydrogen gets set on fire or the tank bursts

wPrior Design Attempt #4 - Magnetic Powered Cars.

Include main details about this prior design attempt

Analysis

This magnetic engine is not perpetual motion since this is powered with a battery instead of running on its own with magnets only.

Provide evidence and explain what parts of this prior design attempt were unsuccessful at solving the defined problem and why based on design requirements.

According to the patent, it mentions that it consumes a lot of energy and the magnetic force meaning this is going to require a lot of supply of electricity to keep it running.,.
