

Consideration of Design Viability:

The design that Colton, George, and I ultimately chose was Colton's idea. His idea resembled a wagon arm and handle, which we believed would be perfect for the pushcart that Mr. Kiser had been struggling with. Mr. Kiser, unfortunately, had been experiencing significant back problems, which were exacerbated by having to bend down frequently to use his current push cart. This new design aimed to alleviate that strain and provide a more ergonomic solution.

We didn't make our decision lightly. There were several key criteria that we considered carefully. First and foremost was comfort. We wanted to ensure that the new design would be as comfortable as possible for Mr. Kiser to use, minimizing any additional strain on his back. Stability was also a crucial factor; the cart needed to be steady and reliable, particularly given Mr. Kiser's back issues. Compactness was important too—we didn't want the cart to be cumbersome or take up too much space, as it needed to be easy to store and maneuver.

Another significant aspect was adjustability. We realized that Mr. Kiser's needs might change over time, and we wanted the design to be flexible enough to accommodate those changes. The cart had to be appealing to the eye as well; we aimed for a design that was not only functional but also aesthetically pleasing. And of course, the design had to address the primary problem at hand: reducing the physical strain on Mr. Kiser when using the pushcart.

Our approach was systematic and thorough. We spent considerable time researching various designs, testing different prototypes, and gathering feedback. This process allowed us to refine our concept continually. Each tweak and adjustment brought us closer to the ideal solution. The final design, which closely resembled a wagon arm and handle, emerged as the best option. It not only met all our criteria but exceeded our expectations in many ways. For instance, the handle's height could be easily adjusted, allowing Mr. Kiser to maintain a comfortable posture without straining his back. The cart's compact design also meant it could be stored in small spaces, making it highly convenient.

We also considered the materials used in the construction of the cart. We opted for lightweight yet durable materials to ensure that the cart was easy to push and would withstand daily use. The aesthetic appeal was achieved through a sleek and modern design, which we felt added a touch of elegance. Furthermore, the stability of the cart was enhanced by a well-engineered base that provided excellent balance and support.

All these factors together guided our decision, and we felt confident that Colton's idea met all these criteria effectively. We were eager to present our design to Mr. Kiser, believing that it would significantly improve his daily routine and alleviate his back issues. The collaborative effort and attention to detail in our design process highlighted our commitment to creating a practical and user-friendly solution.
