

ELEMENT F

Wood scraps- No cost we found and used old wood pieces, without this wood the whole project wouldn't be able to function unless we used another material because the base is plywood, the frame is cut up 2 by 4s and the sidewalls holding the frame is cut up 2 by 4s.

Screws- No cost- We used old already used screws from where I replaced the floor in a shop.

Drill- No cost- We borrowed the drill from one of our stakeholders Mr Roberson.

Circular saw- No cost- We borrowed the saw from Mr Roberson.

Hinges- 5 dollars- We went to Ace hardware and bought a set of 2 hinges for the roof to open and close.

Motor- 15 dollars- Mr Roberson provided us with this motor which we had to upgrade because the first motor didn't have enough torque to open and close the roof.

Batteries- 10 dollars- Mr Roberson provided us with 2 12 volt batteries in order to help lift the roof as one was not providing enough torque.

Roof- No cost- We found the plastic light weight like material and cut it to scale since it was much lighter than the sheet of plywood that was the original motor.

String- No cost- I cut some string off of a roll from home and used it to pull the roof open and closed with the help of the motor.
