

Element F: Consideration of Design Viability

We assessed the feasibility of our project by considering the cost of the rain barrels, the available space to install the rain barrels, and how we could get funded for the rain barrels.

Through comparing prices on rain barrels (and cost-effective government rain barrels) we found a few options within the school budget. Furthermore we evaluated the sustainability of our rain barrels, and we are going to only use the highest quality components to finish the build. Overall if we get the money we need the project is very feasible and could be completed in the time restriction.
